

DOORS Project: Installation Manual

1. Prerequisites

- **Unity 2021.3 or newer.** The package was created using Unity 6 LTS. Make sure your Unity Editor version meets this requirement.
- **Unity Input System** package installed and enabled.
- **AI Navigation** (required for the demo scene).
- **TextMeshPro** package installed.

2. Importing ProjectDoors

1. Open your Unity project.
2. Navigate to **Window > Package Manager > My Assets**.
3. Locate **ProjectDoors** in your purchased assets list, then download and install it.

Note: After import, Unity may briefly recompile scripts. Wait until it's finished.

3. Configure with the Pipeline Importer

After the package finishes installing, the Pipeline Importer checks whether your project requires additional configuration. If an update is needed, the importer window opens automatically. If it does not appear it means your project is using the Built-In pipeline and it doesn't need an update, if you need you can also launch it manually from **Tools > DOORS Project > Pipeline Importer**.

1. The importer detects whether your project uses the Built-In Render Pipeline, URP, or HDRP.
 - For URP or HDRP, click **Import** to automatically load the corresponding files for the correct pipeline
 - For the Built-In pipeline, no import is required; simply close the window.
2. The importer installs the **AI Navigation** and **Input System** packages and asks to apply the provided tags and layers preset.
3. When finished, choose **Load Demo** to open the example scene or **Close** to exit.

4. Project Setup After Import

Input System Configuration

Ensure the New Input System is enabled in your project (Unity defaults to it, but verify in **Edit > Project Settings > Player**).

Layer Setup

For the demo to function correctly, required tags and layers must be configured:

- After the successful installation, the **Tags & Layers automatic import window** will appear and you can choose to import the tags and layers or skip (this may overwrite your own tags and layers if you have any).
- If the **Tags & Layers automatic import window** doesn't appear you can always import the tags and layers by:
 - using the **Tools → DOORS Project → Import Tags and Layers** menu or
 - by editing ProjectSettings/TagManager.asset or
 - using Unity's **Project Settings → Tags and Layers** panel.

5. Text Mesh Pro Essentials

- This Project requires the **TMP Essentials** for the Demo scene to properly function, for this purpose before pressing the Finish button a window to import the TMP Essential will appear and you can choose to install the TMP Essentials (this window will appear only if you don't have the TMP Essentials present in your project).

6. Run the Demo

- By using the Pipeline Importer window and automatically load the demo scene by using the **Load Demo** button.
- using the **Tools → DOORS Project → Load Default Scene**
- By manually launching the scene **Project_Doors-Scene** from **Assets/ANSTUDIO/Doors Project/Demo/Scene/**

7. Additional Documentation

Detailed API and usage manuals are included in `Assets/ANSTUDIO/Doors Project/Manuals` as PDF files:

- **DOORS_PROJECT-API_Manual.pdf**
- **DOORS_PROJECT-UsageManual.pdf**
- **DOORS_PROJECT-extended-functions-manual.pdf**
- **DOORS_PROJECT-installation-instructions-manual.pdf**

Refer to these manuals for comprehensive configuration and scripting details.

8. Additional Checks & Notes

1. Changing Pipelines Later?

- If you switch from URP to HDRP (or vice versa) later, you can always use the existing `DOORSPROJECT_HDRP` and `DOORSPROJECT_URP` found in **`Assets/ANSTUDIO/Doors Project/Pipeline Importer/Pipelines`** to re-import the correct pipeline package.

2. Verifying AI Navigation & Input System

- At Installation Unity will prompt you to install the **`unity.ai.navigation` and `unity.inputsystem`** dependencies (**recommended**)
- Check **`Packages/manifest.json`** in your project folder to confirm that **`"com.unity.ai.navigation"`** and **`"com.unity.inputsystem"`** appear under "dependencies". If you see them, they are installed.
- You can also open **Window → Package Manager** and ensure both packages are visible under **In Project**.

3. Enabling the New Input System

- This project requires the New Input System features, open **Edit → Project Settings → Player → Other Settings** and set **Active Input Handling** to **Input System Package (New)**. Unity might prompt a restart.

9. Troubleshooting

- **Demo materials appear pink or missing.**

Use the Pipeline Importer to align the project files to the project's render pipeline.

- **Pipeline Importer window does not appear.**

Use **Tools > DOORS Project > Pipeline Importer** to open it manually.

- **Doors do not respond to clicks or key presses.**

Confirm the Input System package is active and that the required event channels, tags and layers are loaded.

- **AI Navigation and Input System doesn't install automatically.**

You can always use the Unity's **Package Manager** to install them manually.

- **Tags & Layers automatic import window doesn't appear.**

Import the tags and layers by:

- using the **Tools → DOORS Project → Import Tags and Layers** menu or
- by editing **ProjectSettings/TagManager.asset** or
- using Unity's **Project Settings → Tags and Layers** panel.

10. Frequently Asked Questions

Q: Where can I find more detailed documentation?

A: Additional PDF manuals are located under **Assets/ANSTUDIO/Doors Project/Manuals**.

B: On the www.anstudio.ro website on the Documentation Section

Q: What Unity versions are supported?

A: The package was created with Unity 6 LTS. but it will also run using Unity 2021.3 or newer.

Your Unity project should now have:

- The correct **DOORS Project** pipeline resources (URP, HDRP, or Built-In).
- **AI Navigation** and **Input System** installed (if they were missing).
- The correct **Tags & Layers**.

Enjoy using the **DOORS Project**.
